WHAT IS CLAIMED IS:

- 1. A motorized window covering, comprising:
 - a remote control unit;
 - a transmitter within the remote control unit;
 - an actuator coupled to the window covering;
 - a receiver within the actuator, the receiver receiving at least one signal from the transmitter;
 - a wake-up signal amplifier electrically connected to the receiver; and
 - a data signal amplifier electrically connected to the receiver.
- 2. The motorized window covering of Claim 1, wherein at least one wake-up signal is transmitted by the transmitter and received by the receiver.
- 3. The motorized window covering of Claim 2, wherein at least one data signal is transmitted by the transmitter and received by the receiver.
- 4. The motorized window covering of Claim 3, wherein the wake-up signal amplifier is energized continuously.
- 5. The motorized window covering of Claim 4, wherein the data-signal amplifier is de-energized until the wake up signal is received at the receiver.
- 6. The motorized window covering of Claim 5, wherein the data-signal amplifier is de-energized if the data signal is not received at the receiver within a predetermined time period.
- 7. A method for controlling a motorized window covering, comprising the acts of:

20

deactivating a data signal amplifier; activating a wake-up signal amplifier; and activating the data signal amplifier only in response to a wake-up signal being received by the wake-up signal amplifier.

5 8. The method of Claim 7, further comprising the act of:

when a data signal is received at the data signal amplifier, operating the motorized window covering in response thereto.

- 9. The method of Claim 8, further comprising the act of:
 if a data signal is not received within a predetermined time period, deactivating the data signal amplifier.
- 10. The method of Claim 7, wherein the wake-up signal is generated by a remote control unit.
- 11. The method of Claim 8, wherein the data signal is generated by a remote control unit.
- 15 12. A system for controlling a motorized window covering, comprising:

 an actuator mechanically coupled to an operator of the window covering;
 - a receiver within the actuator;
 - a wake-up signal amplifier electrically connected to the receiver;
 - a data signal amplifier electrically connected to the receiver; and
 - a processor within the actuator, the processor including a program for controlling the actuator in response to at least one wake-up signal and at least one data signal being received by the receiver.

5

- 13. The system of Claim 12, wherein the program includes:

 means for deactivating a data signal amplifier;

 means for activating a wake-up signal amplifier; and

 means for activating the data signal amplifier only in response to a wake-up signal being received by the wake-up signal amplifier.
 - 14. The system of Claim 13, wherein the program further includes:

 means for operating the motorized window covering in response to the data signal being received by the receiver.
 - 15. The system of Claim 14, wherein the program further includes: means for deactivating the data signal amplifier if a data signal is not received within a predetermined time period.
 - 16. The system of Claim 12, further comprising: means for generating the wake-up signal.
 - 17. The system of Claim 12, further comprising: means for generating the data signal.
 - 18. The system of Claim 12, further comprising a head rail supporting a motor of the actuator and holding at least one battery electrically connected to the motor.
 - 19. The system of Claim 18, wherein the at least one battery is an alkaline or Lithium battery.
- 20. The system of Claim 18, wherein the at least one battery is the sole source of power for the motor.
